Plant Breeding has been successfully achieved in case of wheat, rice, sugarcane, maize, barley and many other crop plants. But this technique is specially useful for propagation of medicinal plants which grow slowly and cannot be bred in the conventional methods.

Application of Biotechnology in Plant Breeding

On the other hand, plant biotechnology uses the genetic engineering techniques that result in impressive development of plants with favorable genetic compositions. Plant biotechnology includes plant propagation, plant breeding and cloning. Plant propagation, on the other hand, refers to the process of creating new plants.

Genetically modified plants have been engineered for scientific research, to create new colours in plants, deliver vaccines, and to create enhanced crops. Plant genomes can be engineered by Chemical methods or by use of Agrobacterium for the delivery of sequences hosted in T-DNA binary vectors. Many plant cells are pluripotent, meaning that a single cell from a mature plant can be harvested and ...

Plant regeneration involves the in vitro culture of cells, tissues, and organs under defined physical and chemical conditions. Critical for in vitro plant propagation and biotechnology, this phenomenon is also applicable to studies of plant developmental regulatory mechanisms.

Micro-Propagation: Methods and Stages / Biotechnology

When we propagate by vegetative cuttings (cloning), we remove a section of the plant and root it to grow on as a new plant.

There are many plants that can be propagated this way and it's much faster than growing from seed. Cuttings are clones of the parent plants with identical genetic code, whereas seeds may not be.
