The reservoir had about 850 BCF of natural gas, some of which is frozen in the hydrate. The gas composition is 98.6% methane, 0.1% ethane, 0.1% C₃ +, 0.5% carbon dioxide, and 0.7% nitrogen. The top of the reservoir is at a depth of slightly more than 700 m and the porous formation extends to about 900 m.

Gas condensate reservoirs are gas systems that reside in reservoirs with the original temperatures lying between the critical temperature, T_C , and the cricondentherm (T_{max} in Figure 2.11). If the original reservoir pressure is greater than the dew-point pressure, then a single-phase gas system will occur in the reservoir as in Figure 2.15.

Petroleum and Gas Engineering - University of Portsmouth

Petroleum and Natural Gas Engineering is a field of engineering related to the production of hydrocarbon resources, which can be either crude oil or natural gas. As such, petroleum and natural gas engineers predominantly work in the upstream sector of the oil and energy industries, which comprises exploration, field development, well drilling, and production well optimization activities.

Petroleum and Natural Gas Engineering, B.S. & Penn State

The central job of a petroleum and natural gas engineer is to safely and effectively extract oil and gas from deep subsurface rock formations, which is known as a reservoir. To achieve that, petroleum and natural gas engineers need to characterize or describe the reservoir properties, design the well trajectory and the drilling process, and manage well production.
